YOUR SIGNATURE: \_\_\_\_\_

For your information: There are six problems on this exam.

1. (14 points) Let

$$A = \begin{bmatrix} 0 & 0 & -4 & 1 \\ -1 & 4 & -4 & 8 \\ 2 & 4 & -4 & -5 \\ 1 & 2 & 0 & -6 \end{bmatrix}.$$

B=

$$\begin{bmatrix} 1 & 2 & 0 & -6 \\ 0 & 6 & -4 & 2 \\ 0 & 0 & -4 & 7 \\ 0 & 0 & 0 & -6 \end{bmatrix}$$

(a) Using elementary row operations, transform  $A$  to an upper triangular matrix  $B$ . Write your matrix  $B$  in the box provided.

$$A \xrightarrow{R_1 \leftrightarrow R_4} \begin{bmatrix} 1 & 2 & 0 & -6 \\ -1 & 4 & -4 & 8 \\ 2 & 4 & -4 & -5 \\ 0 & 0 & -4 & 1 \end{bmatrix} \xrightarrow{\begin{array}{l} R_2 + R_1 \\ R_3 - 2R_1 \end{array}} \begin{bmatrix} 1 & 2 & 0 & -6 \\ 0 & 6 & -4 & 2 \\ 0 & 0 & -4 & 7 \\ 0 & 0 & -4 & 1 \end{bmatrix}$$

$$\xrightarrow{R_4 - R_3} \begin{bmatrix} 1 & 2 & 0 & -6 \\ 0 & 6 & -4 & 2 \\ 0 & 0 & -4 & 7 \\ 0 & 0 & 0 & -6 \end{bmatrix}$$

Grading note: There are infinitely-many correct solutions. If a student labeled row operations clearly, and if multiplying the determinant of  $B$  by the appropriate scalars resulting from clearly labeled EROs gave the correct determinant of  $A$ , full credit was awarded. If a student labeled row operations clearly, but the resulting determinant was not correct, 2/4 points was awarded.

This problem continues on the next page.

(b) Calculate the determinant of the matrix  $B$  you found in (a).

$$(1)(6)(-4)(-6) = 144.$$

Answer:

144

(c) Calculate the determinant of  $\frac{1}{2}B$ .

$$\left(\frac{1}{2}\right)^4(144) = \frac{144}{16} = 9$$

Answer:

9

(d) Calculate the determinant of the original matrix  $A$ .

Of the row operations performed in part (a), only the first — permuting rows 1 and 4 — affect determinant. That operation multiplies the determinant by  $-1$ .

Answer:

-144

2. (15 points)

Let  $W = \{A \in M_{2 \times 2}(\mathbb{R}) \mid \text{trace}(A) = 0\}$ . (Recall that  $\text{trace}(A)$  is the sum of the diagonal entries of  $A$ .)

Show that  $W$  is a subspace of  $M_{2 \times 2}(\mathbb{R})$ .

①  $\vec{0} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$  has trace 0. So  $W$  is not empty.

② Suppose  $A, B \in W$ .  
 $\text{tr}(A+B) = \text{tr}(A) + \text{tr}(B) = 0 + 0 = 0$ .  
So  $W$  is closed under vector addition.

③ Suppose  $A \in W$  and  $\lambda \in \mathbb{R}$ .  
 $\text{tr}(\lambda A) = \lambda \text{tr}(A) = \lambda(0) = 0$ .  
So  $W$  is closed under scalar multiplication.

Hence  $W$  is a subspace of  $M_{2 \times 2}(\mathbb{R})$ .

Alternate proof:

If  $A \in W$ , then  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$  where  $a+d=0$ .  
So  $d=-a$ . Then  $W = \left\{ A \in M_2(\mathbb{R}) \mid A = \begin{bmatrix} a & b \\ c & -a \end{bmatrix} \text{ for scalars } a, b, c \right\}$ .

Hence  $W = \text{span} \left\{ \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix} \right\}$ .

The span of a subset of  $V$  is always a subspace of  $V$ .

Really alternate proof.

$T: M_{2 \times 2}(\mathbb{R}) \rightarrow \mathbb{R}$  by  $T(A) = \text{trace}(A)$  is a linear transformation. Its kernel is  $W$ . The kernel of a linear transformation is a subspace of the domain.

3. (12 points) Let

$$S = \left\{ \begin{bmatrix} 1 \\ 0 \\ 3 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \\ 1 \\ 2 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \\ t \\ 2 \end{bmatrix} \right\}$$

be a collection of vectors in  $\mathbb{R}^4$ .

(a) For what values of  $t$  is  $S$  a spanning set for  $\mathbb{R}^4$ ?

Since  $\dim(\mathbb{R}^4) = 4$ , any spanning set must have at least 4 vectors.

Answer:  
No possible  $t$ .

(b) For what values of  $t$  is  $S$  linearly independent?

Set  $A = \begin{bmatrix} 1 & 1 & 1 \\ 0 & -1 & -1 \\ 3 & 1 & t \\ 0 & 2 & 2 \end{bmatrix} \xrightarrow{R_3 - 3R_1} \begin{bmatrix} 1 & 1 & 1 \\ 0 & -1 & -1 \\ 0 & -2 & t-3 \\ 0 & 2 & 2 \end{bmatrix}$

$\xrightarrow{\substack{R_3 - 2R_2 \\ R_4 + 2R_2}} \begin{bmatrix} 1 & 1 & 1 \\ 0 & -1 & -1 \\ 0 & 0 & t-1 \\ 0 & 0 & 0 \end{bmatrix}$ . Then the columns are independent if and only if  $t-1 \neq 0$ .

Answer:  
 $t \neq 1$ .

(c) In the case  $S$  is linearly **dependent**, find a basis for  $\text{Span}(S)$ .

If  $t=1$ , the last row operator above

gives

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & -1 & -1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Hence columns 1 and 2 of  $A$  are independent.

Answer:  
 $\beta = \left\{ \begin{bmatrix} 1 \\ 0 \\ 3 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \\ 1 \\ 2 \end{bmatrix} \right\}$

4. (20 points) For each of the following subspaces  $W$  of the given vector spaces  $V$ , determine a basis  $\beta$  for  $W$  and find its dimension. You do not have to prove that  $W$  is a subspace. You should show enough work to convince a reader that you have provided an independent spanning set. Further proof is not required.

(a)  $V = P_2(\mathbb{R})$  and  $W = \{p(x) \in P_2(\mathbb{R}) \mid p''(0) = p'(2)\}$ .

let  $p(x) \in P_2(\mathbb{R})$ . Set  $p(x) = ax^2 + bx + c$ .

$$p'(x) = 2ax + b$$

$$p'(2) = 4a + b$$

$$p''(x) = 2a$$

$$p''(0) = 2a$$

$$\text{If } 2a = 4a + b$$

$$\text{then } b = -2a$$

So a vector in  $W$  has the form

$$ax^2 - 2ax + c.$$

$$\beta = \left\{ x^2 - 2x, 1 \right\}.$$

This problem continues on the next page.

(b) (The instructions for this problem appear on the previous page.)

$$V = M_{3 \times 3}(\mathbb{R}) \text{ and } W = \{A \in M_{3 \times 3}(\mathbb{R}) \mid \text{trace}(A) = 0\}$$

(Note: Trace is defined in Q2, but this  $V$  is the  $3 \times 3$  matrices, not the  $2 \times 2$  ones in Q2.)

A vector in  $W$  has the form

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & -a_{11} - a_{22} \end{bmatrix}, \text{ as } \begin{aligned} \text{trace}(A) &= a_{11} + a_{22} - a_{11} - a_{22} \\ &= 0. \end{aligned}$$

Then we get

$$B = \left\{ \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & -1 \end{bmatrix}, \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -1 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}, \right. \\ \left. \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 1 & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix} \right\}$$

5. (15 points) Let

$$A = \begin{bmatrix} 1 & 0 & 2 & 1 & 0 \\ -1 & 2 & 3 & 0 & 1 \\ 0 & 2 & 2 & -2 & 1 \end{bmatrix}.$$

(a) Determine a basis for column space of A and **find its dimension**.

$$A \xrightarrow{R_2 + R_1} \begin{bmatrix} 1 & 0 & 2 & 1 & 0 \\ 0 & 2 & 5 & 1 & 1 \\ 0 & 2 & 2 & -2 & 1 \end{bmatrix} \xrightarrow{R_3 - R_2} \begin{bmatrix} 1 & 0 & 2 & 1 & 0 \\ 0 & 2 & 5 & 1 & 1 \\ 0 & 0 & -3 & -3 & 0 \end{bmatrix}$$

$$\begin{array}{l} \frac{1}{2} R_2 \\ -\frac{1}{3} R_3 \end{array} \rightarrow \begin{bmatrix} 1 & 0 & 2 & 1 & 0 \\ 0 & 1 & \frac{5}{2} & \frac{1}{2} & \frac{1}{2} \\ 0 & 0 & 1 & 1 & 0 \end{bmatrix} \begin{array}{l} R_1 - 2R_3 \\ R_2 - \frac{5}{2}R_3 \end{array} \rightarrow \begin{bmatrix} 1 & 0 & 0 & -1 & 0 \\ 0 & 1 & 0 & -2 & \frac{1}{2} \\ 0 & 0 & 1 & 1 & 0 \end{bmatrix}$$

In this RREF form E, the first 3 columns are independent. Hence the first 3 columns of A are independent.

Alternative Solution. (Justification required for credit.)  
 Since  $\text{rank}(A) = 3$ , the column space of A is a 3-dimensional subspace of  $\mathbb{R}^3$ . So the column space is equal to  $\mathbb{R}^3$ . Therefore any basis for  $\mathbb{R}^3$  will suffice.

Answer:

$$\beta = \left\{ \begin{pmatrix} 1 \\ -1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 2 \\ 2 \end{pmatrix}, \begin{pmatrix} 2 \\ 3 \\ 2 \end{pmatrix} \right\}$$

This problem continues on the next page.

(b) Determine a basis for null space of  $A$  and **find its dimension**.

$$E = \begin{bmatrix} 1 & 0 & 0 & -1 & 0 \\ 0 & 1 & 0 & -2 & \frac{1}{2} \\ 0 & 0 & 1 & 1 & 0 \end{bmatrix}$$

Set  $x_4 = s, x_5 = t$

$$\begin{aligned} x_1 - s &= 0 \\ x_2 - 2s + \frac{1}{2}t &= 0 \\ x_3 + s &= 0 \end{aligned}$$

$$\text{null}(A) = \left\{ (s, 2s - \frac{1}{2}t, -s, s, t) \mid s, t \in \mathbb{R} \right\}$$

$$B = \left\{ (1, 2, -1, 1, 0), (0, -\frac{1}{2}, 0, 0, 1) \right\}$$

Answer:

$$B = \left\{ (1, 2, -1, 1, 0), (0, -\frac{1}{2}, 0, 0, 1) \right\}$$

dim = 2

(c) Show that your results in (a) and (b) satisfy the conclusion of the Rank-Nullity Theorem.

$$\text{rank } A = 3, \dim(\text{null}(A)) = 2, \# \text{ of columns} = 5.$$

$$5 = 3 + 2 \quad \checkmark$$

6. (24 points) Please mark each question true or false. Please fill in the box or use a check mark *in* the box rather than circling your answer. If you make a mistake, correct it and leave a note for your grader confirming your final answer.

Partial credit will not be offered for this problem. You do not need to justify your answer.

(a) The set of all  $2 \times 2$  matrices  $A$  with real entries such that  $\det A = 0$  is a subspace of  $M_{2 \times 2}(\mathbb{R})$ .

True

False

Not closed under addition.

$$\det \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} = 0 \quad \text{or} \quad \det \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} = 0, \quad \text{but}$$

$$\det \left( \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} + \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} \right) = 1.$$

(b) The subset

$$V = \{A \in M_{2 \times 2}(\mathbb{R}) \mid A + I \text{ is invertible}\}$$

is a subspace of  $M_{2 \times 2}(\mathbb{R})$  (Here  $I$  is the  $2 \times 2$  identity matrix.)

True

False

Not closed under addition:

$$\begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} + I = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \text{ is invertible}$$

$$\begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} + I = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} \text{ is invertible.}$$

$$\begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} + \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} + I = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix} \text{ is not invertible.}$$

(c) Let  $A$  be an  $n \times n$  matrix such that  $A^T A = I_n$ , where  $I_n$  is the  $n \times n$  identity matrix. Then  $\det(A) = \pm 1$

True

False

$$\text{Since } \det(A^T) = \det A$$

$$\det(A^T A) = \det(A^2) = (\det A)^2.$$

$$\text{If } (\det A)^2 = \det(I_n) = 1,$$

$$\text{then } \det A = \pm 1.$$

(d) Let  $A \in M_{m \times n}(\mathbb{R})$  and  $m < n$ . Then the column space and the nullspace of  $A$  are subspaces of  $\mathbb{R}^n$ .

- True      The column space is a subspace of  $\mathbb{R}^m$ .
- False

(e) If an  $m \times n$  matrix has rank  $n$ , then  $m \geq n$ .

- True      # rows  $\geq$  rank
- False

(f) A  $3 \times 4$  matrix could have equal rank and nullity, but a  $4 \times 3$  matrix can not.

- True      Since rank + nullity = # columns,  
if rank = nullity, the # of columns  
must be even.
- False

Scratch Work
